

Subjective Reflections on the Work of William H. Batchelder (and a New Model for Confidence Ratings in Recognition Memory)

E.J. Wagenmakers

Throughout his career, Bill Batchelder has influenced many researchers in the field. At the University of Amsterdam, Bill's work has had particular impact. Here I discuss two recent developments that would have been impossible without Bill's earlier insights. The first development concerns coherent inferences from Multinomial Processing Trees; the second development has resulted in a new model for confidence ratings in recognition memory experiments.
